Who am I?

Each riddle describes an unsupervised algorithm. Name it!

1. Tell me how many teams you want, and I'll plant that many flags. Everyone runs to the nearest one, then I move each flag to the middle of its crowd and do it all again. But if one loud stranger stands way off in the corner, my flag drifts toward him.

2. I need to know how many teams you want, but I refuse to let an imaginary spokesperson stand in empty space. My representative must be a real member of the group. That makes me hard to push around, but auditioning every candidate takes a long time.

3. I don't do black and white, and I don't vote straight-ticket. Ask me which side a point belongs to and I'll say it leans 60% one way and 40% the other. I'm not undecided. I just don't believe in hard party lines.

4. I start out believing everyone is unique, so every point is its own island. Then I pair up the closest neighbors, over and over, until everyone is one big family. Don't ask me how many groups there are up front. Just tell me where to cut.
